

Kubernetes Troubleshooting Guide

Pod CrashLoopBackOff

kubectl describe pod

kubectl logs

Check:

- application startup errors
 - invalid environment variables
 - missing secrets
-

Configuration Issues

Verify:

kubectl get configmap

kubectl get secrets

kubectl describe configmap

DNS Issues

kubectl exec -it -- nslookup rdas-service

Service Connectivity

kubectl get svc

kubectl describe svc rdas-service

Probe Failures

Verify:

/actuator/health endpoint

Check:

kubectl describe pod

Log Inspection

kubectl logs

Follow logs:

kubectl logs -f

Rollout Status

kubectl rollout status deployment/rdas

Rollback:

kubectl rollout undo deployment/rdas
